According to the context information, the metrics used to measure the performance of the model are perplexity (PPL) and BLEU score.

Perplexity (PPL) is a measure of how well a probability distribution or probability model predicts a sample. It may be used to compare probability models. A lower perplexity indicates better performance.

BLEU (Bilingual Evaluation Understudy) score is a metric for evaluating the quality of machine translation output. It measures how similar the machine-generated translation is to the human-generated reference translation. A higher BLEU score indicates better performance.

These metrics are used to evaluate the performance of the Transformer model on the English-to-German translation development set, newstest2013.
